Comment: After reading the proposed rule, it would seem that the geographic-based model would make sense to use all over the country. The greatest concern for consumers is that they get quality service (meaning that they are able to get cellular service wherever they are) and get it for a low price.

If the new system would mean that there is less paperwork and less money being paid out, while giving the licensees more flexibility to modify their operations, then it should only make sense to then make those companies pass on some of the savings to the consumers.

At this day in age, I find it hard to believe that there cannot be a system in place that could allow people to be in a rural area to make a call without worrying about the call being dropped or not go through at all. People need to have comfort that in an emergency, they can make a call.

Everyone should really worry about the consumers in these situations and how to get them the lowest prices for good/great cellular service. If a geographic-based model will allow this, then that is the way the country should be going. I am not an expert by any means, but I am a concerned citizen who wants the best for the every day people.
